Identity Management Solutions

Virtual Border

Do you feel safe?

Virtual Border is a software solution designed for the quick and accurate identification of visitors in facilities with a high frequency of guests or a high level of safety requirements.

Virtual Border replaces traditional log books by reading and recording all data from personal documents and controls the access of each individual according to security regulations of the facility.

On the entrance, this user-friendly software solution enables security guards to do the entire entry procedure in several seconds.

The process includes scanning and reading personal documents, writing visit details, assigning visitor badges and recording entry snapshots.

In the back office, supervisor can see all the visitors who have entered or left the site as well as perform security checks of those visitors prevented from entering the site.

The system generates various reports and statistics which provide accurate details important for your venue.

"Virtual Border provides a working tool for security department"

WHY

- Speed up entry procedure
- Increase security level
- Get full overview of visitors
- Have a evacuation list
- Digitalize entry log books
- Create statistics and reports

WHERE

- Government Facilities
- Lobby Control
- Access Control
- Restricted Areas
- High Security Events
- Entertainment
- Sports Facilities

Safety is everybody's concern

Virtual Border offers various modules, depending on actual needs and security requirements of the facility.

Our experts are continuously developing and implementing carefully designed features which ensures our clients to be one step ahead of increasing security risks.

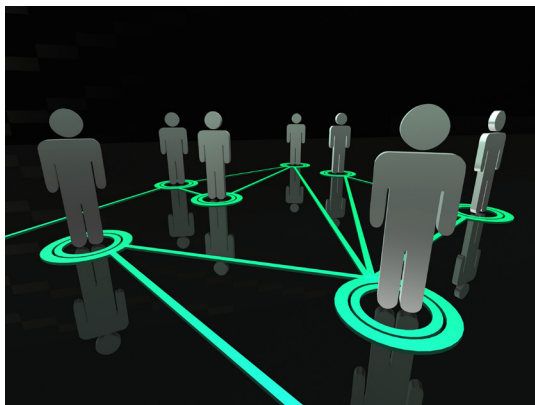

Basic module	Basic module contains visitor gallery with images and personal details. Additional features such as: automatic notifications, search, statistics and reports are included in the basic version of the system.
Scan module	Scan module uses high speed scanners and cameras for scanning and reading personal documents. All details from scanned document are automatically stored into the database.
Access Control module	Access Control module enables populating visit details, printing personalized entry permits, assigning visitor badges and taking automatic live snapshots. Supports barcode and proximity cards from existing access control system.
Video module	Video module enables streaming, recording, archiving and viewing videos from existing CCTV system or standalone IP or HD web cameras. Automatic snapshots or video recording is available for check-in/check-out process.
Client module	Client module enables users to work on remote locations using their tablets. Wireless connection ensures mobility to security staff to easily perform security screening.
Membership module	Membership module enables enrolling and printing personalized membership cards directly from the system. Barcode, magnetic and proximity cards technology are supported.
Events module	Events module is intended for events and conferences which need highest security standards. Printing personalized accreditations with entrance permissions, time validity and unique authentication features.

"We specialize in developing and implementing software solutions for identifying people, verifying identities and managing this information in various fields to enhance the business.

Our software solutions are based on the most innovative ideas and the latest technologies that ensure faster business processes, enhanced business quality and the highest security standards for our customers.

Adria Scan clients include organizations in the field of security, finance, telecommunications and hospitality. Our products are used in more than 40 countries around the world.

Adria Scan team continuously cooperate with security experts in creation of most advanced security solution which incorporates latest state of the art technologies."
